Nature’s patterns
The principle of Geometry

We see the geometry and patterns of Nature everywhere: on the wings of a butterfly, in the markings of a bird’s feathers, in the shape of a leaf or the petals of a flower. They are fascinating to explore and remind us of the incredible beauty of Nature.

Taking photos of Nature’s geometry, particularly if we can get close up, is a great thing to do. The freshness of the colours of spring over the coming weeks will make this an especially enjoyable activity. When you next go out for a walk in Nature, try to take 12 photos of Nature’s patterns, or sketch the patterns and geometry you find. You might want to focus on one theme, such as leaves and flowers, or look for similar patterns and shapes - or ones that contrast. If you are taking photos, keep a steady hand or rest the camera on a flat surface for a great quality image.

TOP TIP:
If you want to share your masterpiece for others to see, please send it to us at info@theharmonyproject.org.uk. Alternatively you could share it on social media using the hashtag #theharmonyproject and tag us using @HarmonyOrgUK

YOUR CHALLENGE:
At home, create a beautiful tableau of your images. You could do this by downloading your photos to a computer and either printing them to create a collage, or using simple image editing software. Alternatively, use your sketches to draw a tableau and add colour. You might want to add labels or a key to show what the different images are. If you want to share your tableau with someone - maybe someone who can’t leave their house at the moment - write a short message to go with it and to say you are thinking of them and that you hope they are well. It is a small act of kindness and it will make a big difference!
